Acunetix Security Audit

19 May 2019

Scan of www.amahogar.com.ar

Scan details

| Scan information | |
|---------------------|----------------------------------|
| Start time | 18/05/2019, 16:25:29 |
| Start url | https://www.amahogar.com.ar/ |
| Host | www.amahogar.com.ar |
| Scan time | 1203 minutes, 26 seconds |
| Profile | Full Scan |
| Server information | Apache/2.4.6 (CentOS) PHP/5.6.33 |
| Responsive | True |
| Server OS | Unix |
| Server technologies | PHP |

Threat level

Acunetix Threat Level 2

One or more medium-severity type vulnerabilities have been discovered by the scanner. You should investigate each of these vulnerabilities to ensure they will not escalate to more severe problems.

Application error message

| Severity | Medium |
|--------------------|---|
| Reported by module | /Scripts/PerScheme/Error_Message.script |

Description

This alert requires manual confirmation

Application error or warning messages may expose sensitive information about an application's internal workings to an attacker.

Acunetix found an error or warning message that may disclose sensitive information. The message may also contain the location of the file that produced an unhandled exception. Consult the 'Attack details' section for more information about the affected page.

Impact

Error messages may disclose sensitive information which can be used to escalate attacks.

Recommendation

Verify that this page is disclosing error or warning messages and properly configure the application to log errors to a file instead of displaying the error to the user.

Directory listing

| Severity | Medium |
|--------------------|---|
| Reported by module | /Scripts/PerFolder/Directory_Listing.script |

Description

The web server is configured to display the list of files contained in this directory. This is not recommended because the directory may contain files that are not normally exposed through links on the web site.

Impact

A user can view a list of all files from this directory possibly exposing sensitive information.

Recommendation

You should make sure the directory does not contain sensitive information or you may want to restrict directory listings from the web server configuration.

HTML form without CSRF protection

| Severity | Medium |
|--------------------|-------------------------------------|
| Reported by module | /Crawler/12-Crawler_Form_NO_CSRF.js |

Description

This alert requires manual confirmation

Cross-Site Request Forgery (CSRF, or XSRF) is a vulnerability wherein an attacker tricks a victim into making a request the victim did not intend to make. Therefore, with CSRF, an attacker abuses the trust a web application has with a victim's browser.

Acunetix found an HTML form with no apparent anti-CSRF protection implemented. Consult the 'Attack details' section for more information about the affected HTML form.

Impact

An attacker could use CSRF to trick a victim into accessing a website hosted by the attacker, or clicking a URL containing malicious or unauthorized requests.

CSRF is a type of 'confused deputy' attack which leverages the authentication and authorization of the victim when the forged request is being sent to the web server. Therefore, if a CSRF vulnerability could affect highly privileged users such as administrators full application compromise may be possible.

Recommendation

Verify if this form requires anti-CSRF protection and implement CSRF countermeasures if necessary.

The recommended and the most widely used technique for preventing CSRF attacks is know as an anti-CSRF token, also sometimes referred to as a synchronizer token. The characteristics of a well designed anti-CSRF system involve the following attributes.

- The anti-CSRF token should be unique for each user session
- The session should automatically expire after a suitable amount of time

- The anti-CSRF token should be a cryptographically random value of significant length
- The anti-CSRF token should be cryptographically secure, that is, generated by a strong Pseudo-Random Number Generator (PRNG) algorithm
- The anti-CSRF token is added as a hidden field for forms, or within URLs (only necessary if GET requests cause state changes, that is, GET requests are not idempotent)
- The server should reject the requested action if the anti-CSRF token fails validation

Cross-site Request Forgery (https://en.wikipedia.org/wiki/Cross-site_request_forgery)

When a user submits a form or makes some other authenticated request that requires a Cookie, the anti-CSRF token should be included in the request. Then, the web application will then verify the existence and correctness of this token before processing the request. If the token is missing or incorrect, the request can be rejected.

PHP allow_url_fopen enabled

| Severity | Medium |
|--------------------|-----------------------------------|
| Reported by module | /Scripts/PerFolder/PHPInfo.script |

Description

The PHP configuration directive allow_url_fopen is enabled. When enabled, this directive allows data retrieval from remote locations (web site or FTP server). A large number of code injection vulnerabilities reported in PHP-based web applications are caused by the combination of enabling allow_url_fopen and bad input filtering.

allow_url_fopen is enabled by default.

Impact

Application dependant - possible remote file inclusion.

Recommendation

You can disable allow_url_fopen from either php.ini (for PHP versions newer than 4.3.4) or .htaccess (for PHP versions up to 4.3.4).

php.ini

allow_url_fopen = 'off'

.htaccess

php_flag allow_url_fopen off

PHP errors enabled

| Severity | Medium |
|--------------------|-----------------------------------|
| Reported by module | /Scripts/PerFolder/PHPInfo.script |

Description

Application error or warning messages may expose sensitive information about an application's internal workings to an attacker.

Acunetix found that the PHP display errors directive is enabled.

Impact

Application error messages may disclose sensitive information which can be used to escalate attacks.

Recommendation

Adjust php.ini or .htaccess (mod_php with Apache HTTP Server) to disable display_errors (refer to 'Detailed information' section).

References

PHP Runtime Configuration (display_errors) (http://php.net/manual/en/errorfunc.configuration.php#ini.display-errors) PHP Runtime Configuration (log_errors) (http://php.net/manual/en/errorfunc.configuration.php#ini.log-errors)

PHP open_basedir is not set

| Severity | Medium |
|--------------------|-----------------------------------|
| Reported by module | /Scripts/PerFolder/PHPInfo.script |

Description

The open_basedir configuration directive will limit the files that can be opened by PHP to the specified directory-tree. When a script tries to open a file with, for example, fopen() or gzopen(), the location of the file is checked. When the file is outside the specified directory-tree, PHP will refuse to open it. open_basedir is a good protection against remote file inclusion vulnerabilities. For a remote attacker it is not possible to break out of the open_basedir restrictions if he is only able to inject the name of a file to be included. Therefore the number of files he will be able to include with such a local file include vulnerability is limited.

Impact

Application dependant - possible remote code inclusion.

Recommendation

You can set open basedir from php.ini

php.ini

open_basedir = your_application_directory

PHPinfo page

| Severity | Medium |
|--------------------|-----------------------------------|
| Reported by module | /Scripts/PerFolder/PHPInfo.script |

Description

PHPinfo page has been found in this directory. The PHPinfo page outputs a large amount of information about the current state of PHP. This includes information about PHP compilation options and extensions, the PHP version, server information and environment (if compiled as a module), the PHP environment, OS version information, paths, master and local values of configuration options, HTTP headers, and the PHP License.

Impact

This file may expose sensitive information that may help an malicious user to prepare more advanced attacks.

Recommendation

Remove the file from production systems.

O Clickjacking: X-Frame-Options header missing

| Severity | Low |
|--------------------|--|
| Reported by module | /Scripts/PerServer/Clickjacking_X_Frame_Options.script |

Description

Clickjacking (User Interface redress attack, UI redress attack, UI redressing) is a malicious technique of tricking a Web user into clicking on something different from what the user perceives they are clicking on, thus potentially revealing confidential information or taking control of their computer while clicking on seemingly innocuous web pages.

The server didn't return an **X-Frame-Options** header which means that this website could be at risk of a clickjacking attack. The X-Frame-Options HTTP response header can be used to indicate whether or not a browser should be allowed to render a page inside a frame or iframe. Sites can use this to avoid clickjacking attacks, by ensuring that their content is not embedded into other sites.

Impact

The impact depends on the affected web application.

Recommendation

Configure your web server to include an X-Frame-Options header. Consult Web references for more information about the possible values for this header.

Documentation file

| Severity | Low |
|--------------------|--|
| Reported by module | /Scripts/PerFolder/Readme_Files.script |

Description

A documentation file (e.g. readme.txt, changelog.txt, ...) was found in this directory. The information contained in these files could help an attacker identify the web application you are using and sometimes the version of the application. It's recommended to remove these files from production systems.

Impact

These files may disclose sensitive information. This information can be used to launch further attacks.

Recommendation

Remove or restrict access to all documentation file acessible from internet.

Possible sensitive directories

| Severity | Low |
|--------------------|--|
| Reported by module | /Scripts/PerFolder/Possible_Sensitive_Directories.script |

Description

A possible sensitive directory has been found. This directory is not directly linked from the website. This check looks for common sensitive resources like backup directories, database dumps, administration pages, temporary directories. Each one of these directories could help an attacker to learn more about his target.

Impact

This directory may expose sensitive information that could help a malicious user to prepare more advanced attacks.

Recommendation

Restrict access to this directory or remove it from the website.

Possible sensitive files

| Severity | Low |
|--------------------|--|
| Reported by module | /Scripts/PerFolder/Possible_Sensitive_Files.script |

Description

A possible sensitive file has been found. This file is not directly linked from the website. This check looks for common sensitive resources like password files, configuration files, log files, include files, statistics data, database dumps. Each one of these files could help an attacker to learn more about his target.

Impact

This file may expose sensitive information that could help a malicious user to prepare more advanced attacks.

Recommendation

Restrict access to this file or remove it from the website.

Content Security Policy (CSP) not implemented

| Severity | Informational |
|--------------------|----------------------------------|
| Reported by module | /httpdata/CSP_not_implemented.js |

Description

Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks, including Cross Site Scripting (XSS) and data injection attacks.

Content Security Policy (CSP) can be implemented by adding a **Content-Security-Policy** header. The value of this header is a string containing the policy directives describing your Content Security Policy. To implement CSP, you should define lists of allowed origins for the all of the types of resources that your site utilizes. For example, if you have a simple site that needs to load scripts, stylesheets, and images hosted locally, as well as from the jQuery library from their CDN, the CSP header could look like the following:

```
Content-Security-Policy:

default-src 'self';

script-src 'self' https://code.jquery.com;
```

It was detected that your web application doesn't implement Content Security Policy (CSP) as the CSP header is missing from the response. It's recommended to implement Content Security Policy (CSP) into your web application.

Impact

CSP can be used to prevent and/or mitigate attacks that involve content/code injection, such as cross-site scripting/XSS attacks, attacks that require embedding a malicious resource, attacks that involve malicious use of iframes, such as clickjacking attacks, and others.

Recommendation

It's recommended to implement Content Security Policy (CSP) into your web application. Configuring Content Security Policy involves adding the **Content-Security-Policy** HTTP header to a web page and giving it values to control resources the user agent is allowed to load for that page.

© Email address found

| Severity | Informational |
|--------------------|--|
| Reported by module | /Scripts/PerFolder/Invalid_Page_Text_Search.script |

Description

One or more email addresses have been found on this page. The majority of spam comes from email addresses harvested off the internet. The spam-bots (also known as email harvesters and email extractors) are programs that scour the internet looking for email addresses on any website they come across. Spambot programs look for strings like myname@mydomain.com and then record any addresses found.

Impact

Email addresses posted on Web sites may attract spam.

Recommendation

Check references for details on how to solve this problem.

Subresource Integrity (SRI) not implemented

| Severity | Informational |
|--------------------|-----------------------------|
| Reported by module | /RPA/SRI_Not_Implemented.js |

Description

Subresource Integrity (SRI) is a security feature that enables browsers to verify that third-party resources they fetch (for example, from a CDN) are delivered without unexpected manipulation. It works by allowing developers to provide a cryptographic hash that a fetched file must match.

Third-party resources (such as scripts and stylesheets) can be manipulated. An attacker that has access or has hacked the hosting CDN can manipulate or replace the files. SRI allows developers to specify a base64-encoded cryptographic hash of the resource to be loaded. The integrity attribute containing the hash is then added to the <script> HTML element tag. The integrity string consists of a base64-encoded hash, followed by a prefix that depends on the hash algorithm. This prefix can either be sha265, sha384 or sha512.

The script loaded from the external URL specified in the Details section doesn't implement Subresource Integrity (SRI). It's recommended to implement Subresource Integrity (SRI) for all the scripts loaded from external hosts.

Impact

An attacker that has access or has hacked the hosting CDN can manipulate or replace the files.

Recommendation

Use the SRI Hash Generator link (from the References section) to generate a <script> element that implements Subresource Integrity (SRI).

For example, you can use the following <script> element to tell a browser that before executing the https://example.com/example-framework.js script, the browser must first compare the script to the expected hash, and verify that there's a match.

```
<script src="https://example.com/example-framework.js"
integrity="sha384-oqVuAfXRKap7fdgcCY5uykM6+R9GqQ8K/uxy9rx7HNQlGYl1kPzQho1wx4JwY8wC"
crossorigin="anonymous"></script>
```
